INTRODUCTION

Weather and climate have a strong influence on the tourism and recreation sector, which is among the largest and fastest growing industries in the world. For example, weather and climate influence the environmental resources that are the foundation for tourism/recreation, the length and quality of tourism and recreation seasons, the health of tourists, and even the quality of tourism experiences.

In spite of the recognized inter-relationships between climate and tourism, there has been no comprehensive resource to date of the growing body of research that examines the interactions of climate and tourism-recreation. 'A Bibliography of the Tourism Climatology Field to 2004' provides a compendium of relevant research that spans more than four decades. The bibliography currently contains over 330 references from academic journals, books, government and university reports, and conference proceedings. To make the bibliography as comprehensive and up-to-date as possible, the authors request other researchers to submit their work or other published studies they are familiar with to the corresponding author (Dr. Daniel Scott). The basic criterion for inclusion in the bibliography are the terms 'climate or weather' and 'tourism or recreation' in the publication's title or keywords. The authors will endeavor to update the bibliography periodically and updated versions of the bibliography can be accessed at the following web sites:
